CYPRES Water Resistant Kit

11/99

Airtec has designed a Water Resistant Kit that allows an existing CYPRES to be made water resistant. The Water Resistant Kit is actually a complete system, consisting of a case for the processing unit, water sensitive filters, sealing gaskets, protection components for the cutter connector and control unit, stainless steel hardware, tools, spare parts and detailed instructions for installing and testing the system. Although all necessary parts are included in the package, the current procedure is that the cutter plugs and the control unit are to be made Water Resistant at either Airtec or SSK for the first time.

As the casing that encloses the CYPRES processing unit slightly increases the overall size, the existing spandex pouch in the reserve container must be replaced with a larger version. This pouch is provided with the Water Resistant System Kit.

The "Water Resistant" CYPRES was designed for intentional water jumps. The installation requires precise and responsible workmanship. Also, as long as the Water Resistant System is installed, it continues to need routine maintenance. Therefore, we recommend that it be used only in applications where needed, such as intentional water landings.

For activities like pond swooping, just the processing unit casing portion could be used, as the risk of damaging the cutter plug or the control unit is reduced when prolonged submersion is not likely.

The Water Resistant Kit is a separate item, (not included with CYPRES).
